

advance of the transmission mode to detect the frequency time tables of all other transmission apparatuses which are performing transmission within the same wave area, and transmission is performed by using a frequency time table the use frequency of which is always different from those of these other transmission apparatuses. When a transmission signal from another apparatus which has requested communication cannot be detected even when a predetermined period of time has passed after starting the transmission mode, retransmission is performed by using a frequency time table different from the frequency time table which has been used. Therefore, radio interference between the transmission apparatuses is avoided.

According to a transmission method of aspect 24, in the transmission method of aspect 22 or 23, when the ID which is permitted to have communication cannot be confirmed in the reception mode, output Of audio or video is stopped. Therefore, interception is avoided.

IN THE CLAIMS:

Please amend claims 1-24, as follows:

1. (Amended) A transmission apparatus comprising:

SCB
D1 } a master station transmitting video or audio by utilizing
a first minute-power wave;

a slave station transmitting video or audio by utilizing
a second minute-power wave; and

B1 } a relay station located between the master station and
the slave station, said master and slave stations located apart
from each other by a distance longer than the reachable range of a
first minute-power wave, wherein

a transmission signal utilizing a first minute-power wave
transmitted from the master station comprises, in addition to
original video or audio information, slave station address
information, and master station receiving frequency information
indicating a frequency at which the master station receives a
signal from the relay station;

said relay station is for modulating at the master
station return frequency a demodulated portion of a first minute-
power wave as a return signal, and for transmitting a return
signal, thereby establishing a return transmission path between the
relay station and the master station;

said relay station is for modulating the frequency of a first minute-power wave received from the master station to a different frequency as a second minute-power wave and for transmitting a second minute-power wave;

BI
SGB
DL
said relay station is for transmitting information about a relay station receiving frequency at which the relay station receives a signal from the slave station;

said slave station is for recognizing that a transmission signal is a signal directed to said slave station; and

said slave station is for modulating and transmitting a response signal comprising video or audio information at said relay station receiving frequency, thereby establishing a transmission path between the master station and the slave station.

2. (Amended) A transmission apparatus as described in Claim 1 wherein:

a standard television signal is used as the transmission signal in the forward path from the master station to the slave station; and

← a PCM audio signal and the information indicating the address of the slave station and the reception frequency specified by the slave station are superposed on a video signal during the vertical blanking period of the video signal.

3. (Amended) A transmission apparatus comprising:

→ SUB
D1 a transmitter having an RF converter which generates a standard television signal;

a receiver having an RF tuner which receives the standard television signal;

available frequency detection means for detecting frequencies for video transmission, within the reception band of the RF tuner, in advance of use;

detected frequency registration means for registering the detected frequencies, as a communication frequency list, in both of the transmitter and the receiver; and

spread spectrum communication means for spreading the power spectrum by changing the frequency within the range of the communication frequency list, and performing spread spectrum communication.

SGB
DI

4. (Amended) A transmission apparatus as described in Claim 3, further comprising transmission power control means for automatically changing the transmission power during the communication in accordance with the use frequency band width for keeping the power density per unit band width constant.

SGB
DI

5. (Twice Amended) A transmission apparatus as described in Claim 3, further comprising frequency changing means for changing the frequency during the communication, in synchronization with the synchronous timing of the video signal.

B2

6. (Twice Amended) A transmission apparatus as described in Claim 3, further comprising control signal superposition and transmission means for transmitting a control signal by superposing said control signal on the video signal in the blanking period, during the communication.

7. (Twice Amended) A transmission apparatus as described in Claim 3, further comprising audio signal superposition and transmission means for subjecting an audio signal to PCM, and

transmitting the PCM audio signal by superposing said PCM audio signal on the video signal in the blanking period, during the communication.

8. (Twice Amended) A transmission apparatus comprising:
first and second transmission/reception apparatuses each comprising a transmission apparatus described in Claim 3;
frequency changing order control means for controlling the frequency changing order, during the communication, so that the frequency is changed in one direction, from a higher frequency to a lower frequency or from the lower frequency to the higher frequency, within a range of the communication frequency list, and when the frequency reaches an end of the frequency list, the frequency is returned to the beginning of the frequency list; and
communication control means for controlling the first and second transmission/reception apparatuses to realize duplex communication, by using a frequency time table in which the first and second transmission/reception apparatuses always use different frequencies.

B3
SUB
DI

9. (Amended) A transmission apparatus as described in Claim 8, further comprising communication frequency list update means which comprises the previously registered communication frequency list when starting the communication, and uses a second communication frequency list obtained by duplicating the registered communication frequency list after the communication has been started, and updates the second communication frequency list by exchanging an indication of successful/unsuccessful communication between the first and second transmission/reception apparatuses.

SUB
DI

10. (Twice Amended) A transmission apparatus as described in Claim 3, further comprising:

B4

ID storage means for storing an identification number (hereinafter referred to as an ID) stored in the transmission apparatus during manufacture; and

ID inquiry and registration means for performing mutual inquiry of IDs with another transmission apparatus which is permitted to have communication in advance of use, and registering the ID.

11. (Amended) A transmission apparatus as described in Claim 10, further comprising:

frequency setting means which always executes the reception mode in advance of the transmission mode to detect frequency time tables of all other transmission apparatuses which are performing transmission within the same wave area, and performs transmission by using a frequency time table a use frequency of which is always different from the frequencies of said all other transmission apparatuses; and

retransmission means for performing retransmission by using a frequency time table different from said frequency time table when a transmission signal from another apparatus which has requested communication cannot be detected even when a predetermined period of time has passed after starting the transmission mode.

12. (Twice Amended) A transmission apparatus as described in Claim 10, further comprising output stop means for stopping output of original audio or video information, when the ID which is

B4 permitted to have communication cannot be confirmed in the reception mode.

B7 13. (Amended) A transmission method for mutually transmitting video or audio between a master station and a slave station by utilizing a minute-power wave, comprising:

SGS
DV locating a relay station between the master station and the slave station which are placed apart from each other by a distance longer than the reachable range of the minute-power wave;

generating a transmission signal from the master station comprising, in addition to original audio or video information , information indicating an address of the slave station, and information indicating a frequency at which the master station receives a signal from the relay station;

modulating by said relay station the frequency of the minute-power wave received from the master station to a different frequency and outputting said different frequency;

transmitting by said relay station information about a frequency at which the relay station receives a signal from the slave station; and

modulating by the slave station the minute-power wave to the frequency specified by the relay station and transmitting the video or audio, thereby establishing a transmission path between the master station and the slave station, when the slave station recognizes that the transmission signal is a signal directed to the slave station.

Sub
D1
14. (Amended) A transmission method as described in Claim 13, wherein:

using a standard television signal as the transmission signal in the forward path from the master station to the slave station; and

superposing a PCM audio signal and the information indicating the destination station and the reception frequency specified by the slave station on a video signal during the vertical blanking period of the video signal.

15. (Amended) A transmission method for performing transmission between a transmitter having an RF converter which

Serial No. 09/423,356

generates a standard television signal, and a receiver having an RF tuner which receives the standard television signal, comprising:

detecting, in advance of use, frequencies for video transmission within a reception band of the RF tuner;

registering the detected frequencies, as a communication frequency list, in both of the transmitter and the receiver; and

spreading the power spectrum by changing the frequency within the range of the communication frequency list, thereby performing spread spectrum communication.

16. (Amended) A transmission method as described in Claim 15, further comprising automatically changing the transmission power during the communication in accordance with the use frequency band width so as to keep the power density per unit band width constant.

17. (Twice Amended) A transmission method as described in Claim 15, comprising changing the frequency during the communication in synchronization with the synchronous timing of the video signal.

18. (Twice Amended) A transmission method as described in Claim 15, transmitting a control signal during the communication by superposing the control signal on the video signal in the blanking period.

19. (Twice Amended) A transmission method as described in Claim 15, further comprising, during the communication, subjecting an audio signal to PCM, and transmitting the PCM audio signal by superposing the PCM audio signal on the video signal in the blanking period.

20. (Twice Amended) A transmission method, comprising:
performing by each of first and second transmission/reception apparatuses performs a transmission method described in Claim 15;

controlling the frequency changing order during the communication so that the frequency is changed in one direction, from a higher frequency to a lower frequency or from the lower frequency to the higher frequency, within a range of the communication frequency list, and when the frequency reaches an end

of the frequency list, the frequency is returned to the beginning of the frequency list; and

B8
SGS
DL
controlling the first and second transmission/reception apparatuses to realize duplex communication, by using a frequency time table in which the first and second transmission/reception apparatuses always use different frequencies.

21. (Amended) A transmission method as described in Claim 20, further comprising:

B9
SGS
DL
using the previously registered communication frequency list when starting the communication and, after the communication has been started, using a second communication frequency list obtained by duplicating the communication frequency list, and updating the second communication frequency list by exchanging an indication of successful/unsuccessful communication between the first and second transmission/reception apparatuses.

B10
SGS
DL
22. (Twice Amended) A transmission method as described in Claim 15, comprising:

Serial No. 09/423,356

storing an identification number (hereinafter referred to as an ID) in the transmission apparatus during manufacture ; and in advance of use, performing mutual inquiry of IDs with another transmission apparatus which is permitted to have communication, and the ID is registered.

23. (Amended) A transmission method as described in Claim 22, comprising:

always performing the reception mode in advance of the transmission mode to detect frequency time tables of all other transmission apparatuses which are performing transmission within a same wave area, and performing transmission by using a frequency time table a use frequency of which is always different from those of these other transmission apparatuses; and

performing retransmission by using a frequency time table different from said frequency time table when a transmission signal from another apparatus which has requested communication cannot be detected even when a predetermined period of time has passed after starting the transmission mode.

Serial No. 09/423,356

24. (Twice Amended) A transmission method as described in
Claim 22, comprising:

not outputting the original audio or video information
when the ID which is permitted to have communication cannot be
confirmed in the reception mode.
